### ABSTRACT

*In this paper, we introduced a new classification of generalized closed sets that are called ultra-generalized s-closed sets named simply  $\widetilde{gis}$ -closed sets, and we show the relationship between this new type with other open, and generalized closed sets. We also investigate advanced  $\widetilde{gis}$ -continuous mappings and some of its properties. Furthermore, we discussed some lower  $\widetilde{gis}$ -separation axioms.*

### INTRODUCTION

Contains Introduction many open, closed generalized closed sets will not stop at certain limit, because we live in infinite evaluation. So many researchers gave us their vision in creation or existence their open and closed sets; they also introduced the applications to those sets. By the way our simple working in this paper aim to create new types of closed set sets that are called  $\widetilde{gis}$ -closed set and we present expansion of  $\widetilde{gis}$ -continuous mapping. Furthermore, we show the investigation properties of these

mappings. In section 2, we define  $\widetilde{gis}$ -open set, and we appear the relationship with some types of generalized closed and open sets. In section 3, we present the notion of  $\widetilde{gis}$ -continuous mapping,  $\widetilde{gis}$ -open mapping,  $\widetilde{gis}$ -irresolute mapping, and  $\widetilde{gis}$ -homeomorphism mapping, and we investigate the relationship between the new type of generalized mapping with some types of continuous mappings, the relationship between  $\overline{is}$ -open mapping, with some types of open mappings and the relationship between  $\overline{is}$ -irresolute mappings with some types of irresolute

mappings. Further, we compare  $\widehat{gis}$ -homeomorphism with other kind of homeomorphisms. Further, we study some of their basic properties.

## METHOD

Our needed in this paper to suggest renaming the topology spaces to  $(X, \tau)$ , and  $(Y, \sigma)$  by  $\tau_o$  and  $\sigma_o$  respectively. We denoted the following notations, characterizations, and definitions. The closure (resp. interior) of a subset  $B$  of a topological space  $\tau_o$  is called by  $Cl(B)$ (resp.  $Int(B)$ ), and the complementation of  $B$  is represented by  $\overline{B}$ .

**Definition 1.1** A subset  $B$  of a topological space  $\tau_o$  is said to be (i) Semi-open set (Levine, 1959) (resp.  $\alpha$ -open set (Njastad, 1965), regular-open set (Levine, 1970),  $i\alpha$ -open set (Mohammed & kahtab, 2012), and  $\overline{is}$ -open set (Y. khattab, 2022)) , if  $B \subseteq Cl(Int(B))$  (resp.  $B \subseteq Int(Cl(B))$ ),  $B = int(cl(B))$ ,  $B \subseteq Cl(B \cap O)$ , where  $\exists O \in \alpha O(X)$ ,  $O \neq X, \emptyset$ , and  $B \subseteq Cl(B \cap O)$ , where  $\exists O \neq \emptyset, O \subseteq SO(X)$ .

The family of all open (resp. semi-open,  $\alpha$ -open, regular open,  $i\alpha$ -open, and  $\overline{is}$ -open) sets of a topological space is denoted by  $\widehat{\tau}$ , (resp.  $\tau_s, \tau_\alpha, \tau_r, \tau_{i\alpha}$ , and  $\tau_{\overline{is}}$ ). The complementation of open (resp.  $\alpha$ -open, semi-open, regular-open,  $i\alpha$ -open, and  $\overline{is}$ -open) sets of a topological space  $X$  is called closed (resp.  $\alpha$ -closed, semi-closed, regular-closed,  $i\alpha$  closed,  $\overline{is}$ -closed) sets. The closure of the above sets is denoted by  $Cl$  (resp.  $Cl_\alpha, Cl_s, Cl_r$ , and  $Cl_{i\alpha}$  and  $Cl_{\overline{is}}$ ).

**Definition 1.2** Let  $B \subseteq \tau_o$ ,  $B$  is said to be

- (i) Generalized closed set (simply, g-closed (Maki et al., 1993)), if  $cl(B) \subseteq O$ , whenever  $B \subseteq O$  and  $O \subset \tau_o$ .
- (ii) Semi-generalized closed (simply, sg-closed) (Bhattacharya & Lahiri, 1987), if  $cl(B) \subseteq O$ , whenever  $B \subseteq O$  and  $O \subset \tau_s$ .

(iii) Generalized semi-closed (simply, gs-closed) (Arya & Nour, 1990), if  $Cl_s(B) \subseteq O$  whenever  $B \subseteq O$  and  $O \subset \tau$ ;

(iv) Generalized  $\alpha$ -closed (simply,  $g\alpha$ -closed) (Maki et al., 1993), if  $Cl_\alpha(B) \subseteq O$  whenever  $B \subseteq O$  and  $O \subset \tau_\alpha$ ;

(v)  $\alpha$ -generalized closed (simply,  $\alpha g$ -closed) (Maki et al., 1994), if  $Cl_\alpha(B) \subseteq O$  whenever  $B \subseteq O$  and  $O \subset \tau$ ;

(i) Regular generalized closed (simply, r-g-closed) (Njastad, 1965), if  $Cl(B) \subseteq O$  whenever  $B \subseteq O$  and  $O \subset \tau_r$ .

(ii) Generalized a regular-closed set (simply,  $g\alpha r$ -closed) (Sekar & Kumar, 2016), if  $Cl_\alpha(B) \subseteq O$  whenever  $B \subseteq O$  and  $O \subset \tau_s$ .

**Definition 1.3** The mapping  $f: \tau_o \rightarrow \sigma_o$  we called:

(i) g-continuous (resp. sg-continuous,  $g\alpha$ -continuous,  $i\alpha$ -continuous, r-g-continuous, and  $\overline{is}$ -continuous) if the inverse image of every open subset of  $\sigma_o$  is g-open (resp. semi g-open,  $g\alpha$ -open,  $i\alpha$ -open, r-g-open, and  $\overline{is}$ -open) set in  $\tau_o$  (Cao et al., 2002; Darwesh & Hassan, 2015; Devi et al., 1997; Mohammed & kahtab, 2012; Rani & Balachandran, 1997; Y. khattab, 2022).

(ii)  $\alpha$ -irresolute (resp. r-g-irresolute, sg-irresolute, and  $\overline{is}$ -irresolute) if the inverse image of every  $\alpha$ -open (resp. r-g-open, sg-open, and  $\overline{is}$ -open) subset of  $\sigma_o$  is an  $\alpha$ -open (resp. r-g-open, sg-open, and  $\overline{is}$ -open) subset in  $\tau_o$  (Maheswari & Prasad, 1978; Rani & Balachandran, 1997; Sundaram et al., 1991; Y. khattab, 2022).

(iii) regular open (resp. rg-open,  $i\alpha$ -open, and  $\overline{is}$ -open) if image of each open set of  $\tau_o$  is regular -open (resp. rg-open,  $i\alpha$ -open, and  $\overline{is}$ -open) in  $\sigma_o$  (Mohammed & kahtab, 2012; Sekar & Kumar, 2016; Stone, 1937; Y. khattab, 2022).

**Definition 1.4** The mapping  $f: \tau_o \rightarrow \sigma_o$  is said to be :

(i)  $g$ -homeomorphism (resp.  $gc$ -homeomorphism,  $i\alpha$ -homeomorphism, and  $\overline{is}$ -homeomorphism) if  $f$  is  $g$ -continuous and  $g$ -open ( resp.  $f$  and  $f^{-1}$  are  $g$ -irresolute, if  $f$  is an  $i\alpha$ -continuous and open, and  $f$  is an  $\overline{is}$ -continuous and open mappings) (Maki et al., 1991, 1994; Mohammed & kahtab, 2012; Y. khattab, 2022).

**Definition 1.5** Let  $(X, \tau_o)$  topology space,  $(X, \tau_o)$  then is defined to be:

(i)  $\overline{is}$ - $T_0$  (Y. khattab, 2022) if  $\forall n \neq m \in X$ ,  $\exists B \subseteq \tau_{\overline{is}}$ , s.t  $n \in B \wedge m \notin B$ .

(ii)  $\overline{is}$ - $T_1$  (Y. khattab, 2022) if  $\forall n \neq m \in X$ ,  $\exists B \wedge C \subseteq \tau_{\overline{is}}$ , s.t  $n \in B \wedge m \notin B, m \in C \wedge n \notin C$ .

(iii)  $\overline{is}$ - $T_2$  (Y. khattab, 2022)  $\forall n \neq m \in X$ ,  $\exists B \neq C \subseteq \tau_{\overline{is}}$ , s.t  $n \in B, \wedge m \in C$ .

(iv)  $\overline{is}$ -regular [10] if  $\forall n \notin \lambda \subseteq \overline{\tau_o}, \exists B \neq C \subseteq \tau_{\overline{is}}$ , s.t  $n \in B \wedge \lambda \subseteq C$ .

(v)  $\overline{is}$ -normal (resp. ultra-normal,  $s$ -normal,  $\alpha$ -normal)  $\forall B \neq C \subseteq \overline{\tau_o}, B \subseteq M \subseteq \tau_{\overline{is}}$  (resp.  $\tau_s, \tau_\alpha, \tau_r$ )  $\neq C \subseteq N \subseteq \tau_{\overline{is}}$  (resp.  $\tau_s, \tau_\alpha, \tau_r$ ) (Arhangel'skii & Ludwig, 2001; Maheswari & Prasad, 1978; Staum, 1974; Y. khattab, 2022).

(vi)  $\overline{is}$ - $T_{1/2}$  (Y. khattab, 2022) if  $\overline{\tau_{\overline{is}}} = \overline{\tau_i}$ .

## RESULTS AND DISCUSSION

### $\widehat{gis}$ -Closed (Open) Sets & Its Applications

**Definition 2.1** Let  $B \subseteq \tau_o$ ,  $B$  is said to be ultra-generalized  $S$ -closed set simply ( $\widehat{gis}$ -closed), if  $Cl_{\overline{is}}(B) \subseteq O$ , whenever  $B \subseteq O, \wedge O \subset \tau_{\overline{is}}$ . The complementation of  $\widehat{gis}$ -closed set is  $\widehat{gis}$ -open set, then collections of  $\widehat{gis}$ -open sets are denoted by  $\tau_{\widehat{gis}}$ .

**Example 2.2**  $X = \{0, 4, 8\}$ ,  $\tau = \{\emptyset, \{8\}, X\}$ ,  $\tau_{\widehat{gis}} = \{\emptyset, \{0\}, \{4\}, \{8\}, \{0, 4\}, \{0, 8\}, \{4, 8\}, X\}$ .

**Lemma 2.3** If  $B \subseteq \tau$  (resp.  $\tau_s, \tau_\alpha$ , and  $\tau_{i\alpha}$ ), then  $B$  is  $\tau_{\overline{is}}$  (Y. khattab, 2022).

**Lemma 2.4** Every  $\overline{is}$ -closed set is  $\widehat{gis}$ -closed sets.

**Proof.** Let  $B \subseteq \tau_{\overline{is}}$  such that  $B \subseteq U$ , where  $U$  is  $\overline{is}$ -open. Since  $Cl_{\overline{is}}(B) \subseteq B$ . It implies  $Cl_{\overline{is}}(B) \subseteq U$ . Therefore,  $B$  is  $\widehat{gis}$ -closed set in  $\tau_o$  ■

**Theorem 2.5** Every closed set is  $\widehat{gis}$ -closed.

**Proof.** Let  $V^c$  is open set in a topological space  $\tau_o$ . Since every open set is  $\overline{is}$ -open set by **Lemma 2.3**, then  $V^c$  is  $\overline{is}$ -open set, consequently  $V$  is  $\overline{is}$ -closed set, since every  $\overline{is}$ -closed set is  $\widehat{gis}$ -closed sets by **Lemma 2.4**, Therefore  $V$  is  $\widehat{gis}$ -closed set ■

**Corollary 2.6** Every semi-closed is  $\widehat{gis}$ -open.

**Proof.** Let  $N^c$  is semi-open set in  $\tau_o$ . Since every semi-open set is  $\overline{is}$ -open by **Lemma 2.3**, hence  $N$  is  $\widehat{gis}$ -closed by **Lemma 2.4**. Therefore,  $N$  is  $\widehat{gis}$ -open ■

**Corollary 2.7** Every  $\alpha$ -closed is  $\widehat{gis}$ -open.

**Proof.** Same the proof **Corollary 2.6** by **Lemma 2.3**, and **Lemma 2.4** ■

**Corollary 2.8** Every  $i\alpha$ -closed is  $\widehat{gis}$ -open.

**Proof.** Same the proof **Corollary 2.6** by **Lemma 2.3**, and **Lemma 2.4** ■

Generally, the converse of above theorems and corollaries are not true as this example.

**Example 2.9**  $X = \{0, 2, 4\}$ ,  $\tau = \tau_\alpha = \{\emptyset, \{2, 4\}, X\}$ ,  $\tau_{\overline{is}} = \{\emptyset, \{4\}, \{2\}, \{2, 4\}, \{0, 2\}, \{0, 4\}, X\}$ , and  $\overline{is}$ -closed sets  $= \{\emptyset, \{2, 0\}, \{0, 4\}, \{0\}, \{4\}, \{2\}, X\}$  we get  $\{2, 4\} \subseteq \{2, 4\}$ ,  $Cl_{\overline{is}}\{2, 4\} \subseteq \{2, 4\}$ , Therefore  $\{a\}$  is  $\widehat{gis}$ -closed but it is not  $\overline{is}$ -closed set, semi-closed,  $\alpha$ -closed, and closed.

**Theorem 2.10** Every  $g$ -closed is  $\widehat{gis}$ -closed.

**Proof.** Let  $V$  is  $sg$ -closed in a topological  $\tau_o$ , such that  $Cl(V) \subseteq O$ , Such that  $V \not\subseteq O \subseteq \tau_o$ , Since every closed is an  $\overline{is}$ -closed by **Lemma 2.3**, then  $Cl_{\overline{is}}(V) \subseteq$

$Cl(V) \subseteq O$ , hence  $Cl(V) \subseteq O$ . Also, since every open set is an  $\overline{is}$ -open **Lemma 2.3**, then  $V \subseteq O \subseteq \tau_{\overline{is}}$ . Therefore,  $V$  is  $\widehat{gis}$ -closed ■

**Theorem 2.11** Every  $sg$ -closed set is  $\widehat{gis}$ -closed set.

**Proof.** Let  $V$  is  $sg$ -closed in  $\tau_o$ , consequently  $Cl(V) \subseteq O$ , Such that  $V \subseteq O \subseteq \tau_s$ , Since every closed is an  $\overline{is}$ -closed by **Lemma 2.3**, then we have  $Cl(V) \subseteq Cl_{\overline{is}}(V) \subseteq O$ . Also, since every semi-open is an  $\overline{is}$ -open, **Lemma 2.3**, then  $V \subseteq O \subseteq \tau_{i\alpha}$ . Therefore,  $V$  is  $\widehat{gis}$ -closed ■

**Corollary 2.12** Every  $gs$ -closed is  $\widehat{gis}$ -closed.

**Proof.** Same the proof of above theorem ■

**Theorem 2.13** Every  $g\alpha$ -closed is  $\widehat{gis}$ -closed.

**Proof.** Let  $V$  is  $g\alpha$ -closed in  $\tau$ , then  $Cl(V)_\alpha \subseteq O$ , Such that  $V \subseteq O \subseteq \tau_\alpha$ , Since every  $\alpha$ -closed is  $\overline{is}$ -closed **Lemma 2.3**, then  $Cl(V)_\alpha \subseteq Cl_{\overline{is}} \subseteq O$ , and since every  $\alpha$ -open is an  $\overline{is}$ -open by **Lemma 2.3**, then  $V \subseteq O \subseteq \tau_{\overline{is}}$ . Therefore,  $V$  is  $\widehat{gis}$ -closed ■

**Corollary 2.14**  $ag$ -closed is  $\widehat{gis}$ -closed.

**Proof.** Same the proof of the above theorem ■

**Remark 2.15** the following example show that  $\widehat{gis}$ -closed set isn't an essential to be  $g$ -closed,  $gs$ -closed, set  $sg$ -closed,  $ag$ -closed, and  $g\alpha$ -closed set.

**Example 2.16**  $X = \{i, j, k\}$ ,  $\tau = \{\emptyset, \{j\}, X\}$ ,  $\tau_\alpha = \{\emptyset, \{j\}, \{j, i\}, \{j, k\}, X\}$ ,  $\tau_{\overline{is}} = \{\emptyset, \{i\}, \{j\}, \{k\}, \{i, j\}, \{i, k\}, \{j, k\}, X\} = \overline{is}$ -closed sets. We get  $\{j, k\} \subseteq \{j, k\}$ ,  $Cl_{\overline{is}}\{j, k\} \subseteq \{j, k\}$ , Therefore  $\{j, k\}$  is  $\widehat{gis}$ -closed but is not  $g$ -closed,  $gs$ -closed, set  $sg$ -closed,  $ag$ -closed, and  $g\alpha$ -closed set.

**Theorem 2.17** Every  $rg$ -closed is  $\widehat{gis}$ -closed set.

**Proof.** Let  $V$  is  $rg$ -closed in  $\tau$ , so we have  $Cl(V) \subseteq O$ , Such that  $V \subseteq O \subseteq \tau_r$ , Since every closed is an  $\overline{is}$ -closed by **Lemma 2.3**, then  $Cl(V) \subseteq Cl_{\overline{is}} \subseteq O$ , and since every regular-open is an  $\overline{is}$ -open **Lemma**

**2.3**, then  $V \subseteq O \subseteq \tau_{\overline{is}}$ . Therefore,  $V$  is  $\widehat{gis}$ -closed ■

**Corollary 2.18** Every  $arg$ -closed is  $\widehat{gis}$ -closed set.

**Proof.** Let  $V$  is a regular-closed -closed, so we have  $Cl_\alpha(V) \subseteq O$ , Such that  $V \subseteq O \subseteq \tau_r$ , Since Every  $\alpha$  closed is  $\overline{is}$ -closed **Lemma 2.3**, then  $Cl_\alpha(V) \subseteq Cl_{\overline{is}} \subseteq O$ , and since every regular -open is an  $\overline{is}$ -open **Lemma 2.3**, then  $V \subseteq O \subseteq \tau_{\overline{is}}$ . Therefore,  $V$  is  $\widehat{gis}$ -closed ■

**Remark 2.19** the following example show that  $\widehat{gis}$ -closed is not a necessary to be  $agr$ -closed,  $rg$ -closed, and set  $arg$ -closed as the following example.

**Example 2.20**  $X = \{0, 5, 10\}$ ,  $\tau = \{\emptyset, \{10\}, X\}$ ,  $\tau_s = \{\emptyset, \{10\}, \{10, 0\}, \{10, 5\}, X\}$ ,  $\tau_{\overline{is}} = \{\emptyset, \{0\}, \{5\}, \{10\}, \{10, 5\},$

$\{10, 0\}, \{0, 5\}, X\} = \overline{is}$ -closed sets. We get  $\{10, 0\} \subseteq \{10, 0\}$ ,  $Cl_{i\alpha}\{10, 0\} \subseteq \{10, 0\}$ , Therefore  $\{10, 0\}$  is  $\widehat{gis}$ -closed but is not  $agr$ -closed,  $rg$ -closed, and set  $arg$ -closed.

**Theorem 2.21** If  $\tau \subset \tau_s$ , then  $\tau_{\widehat{gis}} = \tau_{\overline{is}}$

**Proof.** If  $\tau \subset \tau_s$ , it implies to  $\exists N \subset \tau_s$ , then  $N \notin \tau$ , and hence  $\tau_{\overline{is}} = \text{po}(x)$ , equivalence to all subsets of  $\overline{is}$ -closed set, since every  $\overline{is}$ -closed set is  $g\alpha$ -closed sets by **Corollary 2.4**. Therefore  $\tau_{\overline{is}} = \tau_{\widehat{gis}}$  ■

**Theorem 2.22** If  $M$  and  $N$  are  $\widehat{gis}$ -closed sets in  $(X, \tau)$ , then  $M \cup N$  is  $\widehat{gis}$ -closed set in  $(X, \tau)$ .

**Proof.** Let  $M$  and  $N$  are  $\widehat{gis}$ -closed sets in  $\tau$  and  $U$  be an  $\overline{is}$ -open set containing  $M$  and  $N$ . Therefore  $Cl(M) \subseteq U$ ,  $Cl(N) \subseteq U$ . Since  $M \subseteq U$ ,  $N \subseteq U$  then  $M \cup N \subseteq U$ . Hence  $Cl(M \cup N) = Cl(M) \cup Cl(N) \subseteq U$ . Therefore  $M \cup N$  is  $\widehat{gis}$ -closed set in  $\tau$  ■

**Theorem 2.23** If  $M$  and  $N$  are  $\widehat{gis}$ -closed sets in  $(X, \tau)$ , then  $M \cap N$  is  $\widehat{gis}$ -closed set in  $(X, \tau)$ .

**Proof.** Same the proof of above theorem.

### Some $\widehat{gis}$ -Mappings & its properties

**Definition 3.1** The mapping  $f: \tau_o \rightarrow \sigma_o$  is  $\widehat{gis}$ -continuous if,  $\forall V \subseteq \sigma_o, f^{-1}(V) \subseteq \tau_o \widehat{gis}$ .

**Example 3.2** Let  $N=L= \{0.1, 0.2, 0.3\}$ ,  $\tau = \{\emptyset, \{0.2\}, N\}$ ,  $\sigma = \{\emptyset, \{0.1\}, L\}$ ,  $\widehat{gis}(N) = \{\emptyset, \{a\}, \{d\}, \{h\}, \{a, d\}, \{a, h\}, \{d, h\}, N\}$ . It is obvious; the identity mapping  $f: (N, \tau) \rightarrow (L, \sigma)$  is  $\widehat{gis}$ -continuous.

**Theorem 3.3** If  $f$  is sg-continuous mapping, then  $f$  is  $\widehat{gis}$ -continuous mapping.

*Prof.* Let  $f: \tau_o \rightarrow \sigma_o$  be sg-continuous mapping, and  $N \subseteq \sigma_o(\overline{\sigma_o})$ . Since,  $f$  is sg-continuous, then  $f^{-1}(V)$  is an sg-open (closed)  $\subseteq \tau_o$ . Since, every sg-open set is an  $\widehat{gis}$ -open set by **Theorem 2.11**, then  $f^{-1}(N) \subseteq \tau_o \widehat{gis}$ . Therefore,  $f$  is an  $\widehat{gis}$ -continuous ■

**Theorem 3.4** If  $f$  is  $g\alpha$ -continuous mapping, then  $f$  is  $\widehat{gis}$ -continuous mapping.

*Proof.* Same the proof above By **Corollary 2.13** ■

**Theorem 3.5** Every r-g-continuous mapping is  $\widehat{gis}$ -continuous mapping.

*Proof.* Same the proof of **Theorem 3.3** and by using **Theorem 2.17**. Therefore,  $f$  is an  $\widehat{gis}$ -continuous ■

**Theorem 3.6** Every  $i\alpha$ -continuous mapping is  $\widehat{gis}$ -continuous mapping.

*Proof.* Same the proof of the above theorem, since every  $\overline{is}$ -open set is  $\widehat{gis}$ -open by **Corollary 2.8** ■

**Theorem 3.7** Every  $\overline{is}$ -continuous mapping is  $\widehat{gis}$ -continuous mapping.

*Proof.* Same the proof of the above **Theorem 3.5** by using **Lemma 2.4** ■

$f^{-1}(V)$  is an sg-open (closed) set in  $\tau_o$ . Since, every sg-open set is an  $\widehat{gis}$ -open set by **Theorem 2.11**, then  $f^{-1}(V) \subseteq \tau_o \widehat{gis}$ . ■

**Theorem 3.8** If  $f$  is  $g\alpha$ -continuous mapping, then  $f$  is  $\widehat{gis}$ -continuous mapping.

*Proof.* Same the proof above By **Corollary 2.13** ■

**Theorem 3.9** if  $f$  is r-g-continuous mapping, then  $f$  is  $\widehat{gis}$ -continuous mapping.

*Proof.* Let  $f: \tau_o \rightarrow \sigma_o$  be an r-g-continuous mapping and  $N \subseteq \sigma_o$ . Since,  $f$  is r-g-continuous, then  $f^{-1}(V)$  is an r-g-open set in  $\tau$ , hence  $f^{-1}(N) \subseteq \tau_o \widehat{gis}$  since every r-g-open set is an  $\widehat{gis}$ -open set by **Theorem 2.17**. Therefore,  $f$  is an  $\widehat{gis}$ -continuous ■

The converse of above theorems is not true generally.

**Example 3.10** Let  $H=\{1,3,5\}$ ,  $K=\{3,6,9\}$ ,  $\tau = \{\emptyset, \{1,5\}, H\}$ ,  $\sigma = \{\emptyset, \{6\}, K\}$ ,  $\widehat{gis}(H)=\{\emptyset, \{1\}, \{3\}, \{5\}, \{1,3\}, \{1,5\}, \{3,5\}, H\}$ ,  $\overline{is}(H)=\{\emptyset, \{1\}, \{5\}, \{1,3\}, \{1,5\}, \{3,5\}, H\}$ , the map  $f: (H, \tau) \rightarrow (K, \sigma)$  is define as:  $f(1) = 6, f(3) = (9), f(5) = 3$ . Here is  $f$  is  $\widehat{gis}$ -continuous but is not  $\overline{is}$ -continuous, sg-continuous,  $g\alpha$ -continuous, and rg-continuous mappings, because  $f^{-1}\{9\} = \{3\}$  is only  $gis$ -open set.

**Remark 3.11** We can proof easily in the same way that continuous (resp. semi-continuous,  $\alpha$ -continuous, regular-continuous) mappings are  $\widehat{gis}$ -continuous mapping.

**Definition 3.12** The Mapping  $f: \tau_o \rightarrow \sigma_o$  is  $\widetilde{gis}$ -irresolute, if  $\forall V \subseteq \sigma_o, f^{-1}(V) \subseteq \tau_o$ .

**Example 3.13** Let  $Q=W=\{s,r,t\}$ ,  $\tau = \{\emptyset, \{t\}, Q\}$ ,  $\sigma = \{\emptyset, \{t\}, W\}$ ,  $\widetilde{gis}(Q) = \{\emptyset, \{s\}, \{r\}, \{t\}, \{s,r\}, \{s,t\}, \{r,t\}, Q\}$ ,  $\widetilde{gis}(W) = \{\emptyset, \{s\}, \{r\}, \{t\}, \{s,r\}, \{s,t\}, \{r,t\}, w\}$   $f: (Q, \tau) \rightarrow (W, \sigma)$  is define as :  $f(r)=s, f(s)=t, f(t)=r$ . It is clear the mapping is  $\widetilde{gis}$ -irresolute mapping.

**Theorem 3.14** If  $f$  is  $\alpha$  (resp. rg, and sg)-irresolute mapping, then  $f$  is  $\widetilde{gis}$ -irresolute mapping.

**Proof.** Let  $f: \tau_o \rightarrow \sigma_o$ , be an  $\alpha$  (resp. rg, and sg)-irresolute, and  $H$  any  $\alpha$  (resp. rg, and sg)-open subset of  $\sigma_o$ , hence  $H$  is  $\widetilde{gis}$ -open by (Corollary 2.7, Theorem 2.17 and Corollary 2.11). Since  $f$  is an  $\alpha$ -irresolute, then  $f^{-1}(H)$  is  $\alpha$ -open in  $\tau_o$ , and since every  $\alpha$  (resp. rg, and sg) - open set is  $\widetilde{gis}$ -open set. Therefore  $f$  is  $\widetilde{gis}$ -irresolute mapping ■

**Theorem 3.15** Every  $\widetilde{gis}$ -irresolute is  $\widetilde{gis}$ -continuous mapping.

**Proof.** Clear form Definition 3.12 ■

**Theorem 3.16** if  $f: \tau_o \rightarrow \sigma_o$ , and  $g: \sigma_o \rightarrow Z_o$ , then  $f \circ g: \tau_o \rightarrow Z_o$  is  $\widetilde{gis}$ -irresolute.

**Proof.** Let  $R$  is  $gi\alpha$ -open set in  $Z_o$ , since  $g: \sigma_o \rightarrow Z_o$  is  $\widetilde{gis}$ -irresolute, then  $g^{-1}(R)$  is  $\widetilde{gis}$ -open set in  $\sigma_o$ , since  $f: \tau_o \rightarrow \sigma_o$  is  $\widetilde{gis}$ -irresolute, it imply  $f^{-1}(g^{-1}(R))$  is  $\widetilde{gis}$ -open set in  $\tau_o$ . Therefore  $f \circ g: \tau_o \rightarrow Z_o$  is  $\widetilde{gis}$ -irresolute ■

**Corollary 3.17** if  $g: \sigma \rightarrow Z_o$  is  $\widetilde{gis}$ -irresolute, and  $f: \tau_o \rightarrow \sigma_o$  is  $\widetilde{gis}$ -continuous mapping, prove  $f \circ g$  is  $\widetilde{gis}$ -irresolute.

**Proof.** Same as the proof above Theorem 3.16 ■

**Definition 3.18** The Mapping  $f: \tau_o \rightarrow \sigma_o$  is  $\widetilde{gis}$ -open, if  $\forall N \subseteq \tau_o, f(N) \subseteq \sigma_o$ .

**Example 3.19** Let  $B=\{5,7,9\}$ ,  $C=\{4,6,8\}$ ,  $\tau = \{\emptyset, \{9\}, \{7,9\}, B\}$ ,  $\sigma = \{\emptyset, \{8\}, C\}$ ,  $\widetilde{gis}(C) = \{\emptyset, \{4\}, \{6\}, \{8\}, \{4,6\}, \{4,8\}, \{6,8\}, C\}$   $f: (B, \tau) \rightarrow (C, \sigma)$  is define as:  $f(5)=8, f(7)=4, f(9)=6$ . The mapping is  $\widetilde{gis}$ -open mapping.

**Theorem 3.20** If  $f$  is  $\overline{is}$ -open mapping, then  $f$  is  $\widetilde{gis}$ -open mapping.

**Proof.** Let  $f: \tau_o \rightarrow \sigma_o$  is an  $\overline{is}$ -open function, and  $A$  is any open in  $\tau_o$ , then  $f(A)$  is an  $\widetilde{gis}$ -open in  $\sigma$ , since every  $\overline{is}$ -open is  $\widetilde{gis}$ -open by Lemma 2.4, so  $f(A)$  is  $\widetilde{gis}$ -open. Therefore  $f$  is  $\widetilde{gis}$ -open ■

**Theorem 3.21** if  $f$  rg-open mapping, then  $f$  is  $\widetilde{gis}$ -open.

**Proof.** Same the proof the above theorem by using Theorem 2.17 ■

The converse of Theorems 3.20, and 3.21 are not true ■

**Example 3.22** Let  $B= \{1,2,3\}$ ,  $C=\{4,5,6\}$ ,  $\tau = \{\emptyset, \{2\}, B\}$ ,  $\sigma = \{\emptyset, \{4,6\}, C\}$ ,  $\widetilde{gis}(C) = \{\emptyset, \{4\}, \{6\}, \{8\}, \{4,6\}, \{4,8\}, \{6,8\}, C\}$ . The identity mapping  $f: (B, \tau) \rightarrow (C, \sigma)$  is  $\widetilde{gis}$ -open mapping but it is not  $i\alpha$ -open and rg-open mapping, because  $f\{2\} = \{2\}$  is not  $\overline{is}$ -open and rg-open.

**Theorem 3.23** If  $f: \tau_o \rightarrow \sigma_o$  is open mapping, and  $g: \sigma_o \rightarrow Z_o$  is  $\widetilde{gis}$ -open mapping, then the composition  $f \circ g$  is  $\widetilde{gis}$ -open map.

**Proof.** Let  $H \subset \tau_o$ , snice  $f: \tau_o \rightarrow \sigma_o$  is open map, then  $f(H) \subset \sigma_o$ , also since  $g: \sigma_o \rightarrow Z_o$

is  $\widehat{gis}$ -open map, then  $g(f(H)) \subset Z_0$  is  $\widehat{gis}$ -open. Therefore  $f \circ g$  is  $\widehat{gis}$ -open map ■

### Remark 3.24

i) If  $f$  and  $g$  are  $\widehat{gis}$ -open map, then  $f \circ g$  is not  $\widehat{gis}$ -open map.

ii) The proof of the above **Theorems 3.20** and **3.21** are true for  $\widehat{gis}$ -closed mapping.

iii) The **Diagram 2.24** is true for  $\widehat{gis}$ -open (resp. continuous, and irresolute) mappings

**Theorem 3.25** The bijection mapping  $f: \tau_o \rightarrow \sigma_o$ , these are equivalent statements as the following.

(i)  $f^{-1}: \tau_o \rightarrow \sigma_o$  is  $\widehat{gis}$ -continuous.

(ii)  $f$  is  $\widehat{gis}$ -open map.

(iii)  $f$  is  $\widehat{gis}$ -closed map.

**Proof. (i)  $\Rightarrow$  (ii)** Let  $M \subset \tau_o$ . Since  $f$  is  $\widehat{gis}$ -continuous mapping,  $f^{-1-1}(M) = f(M) \subset \sigma_o$ . Therefore  $f$  is  $\widehat{gis}$ -open map ■

**(ii)  $\Rightarrow$  (iii)** Let  $N \subset \bar{\tau}_o$ , then  $N^c$  is  $\subset \tau_o$ . Since  $f$  is  $\widehat{gis}$ -open mapping,  $f(N^c) \subset \sigma_o$ . Hence  $f(N) \subset \tau_o$ . Therefore  $f$  is  $\widehat{gis}$ -closed mapping ■

**(iii)  $\Rightarrow$  (i)** Let  $R \subset \tau_o$ . Since  $f$  is  $\widehat{gis}$ -closed mapping, then  $f(R) \subset \bar{\sigma}_o$ . Hence  $f(R) = f^{-1-1}(R)$ . Hence  $f^{-1}: \tau_o \rightarrow \sigma_o$  is  $\widehat{gis}$ -continuous ■

**Definition 3.26** A bijection  $g\alpha$ -continuous, and  $g\alpha$ -open mappings (resp.  $f$  and  $f^{-1}$  is  $\widehat{gis}$ -irresolute) is called  $\widehat{gis}$ -homeomorphism (resp.  $\ast\widehat{gis}$ -homeomorphism).

**Theorem 3.27** If  $f$  is rg-homeomorphism, then  $f$  is  $\widehat{gis}$ -homeomorphism.

**Proof.** Let  $f: \tau_o \rightarrow \sigma_o$  is rg-homeomorphism. Hence  $f$  is  $\widehat{gis}$ -continuous because every gr-continuous is  $\widehat{gis}$  by **Theorem 3.9**. In addition, by using **Theorem 21**, then  $f$  is  $\widehat{gis}$ -open mapping. Therefore  $f$  is  $\widehat{gis}$ -homeomorphism ■

**Theorem 3.28** If  $f$  is  $\bar{is}$ -homeomorphism, hence  $f$  is  $\widehat{gis}$ -homeomorphism.

**Proof.** Same the proof of above theorem, but by using **Theorem 3.7**, and **Theorem 3.20** ■

**Remark 3.29** Example 3.10 is enough to proof that the converse of **Theorem 3.27** is not always true.

### $\widehat{gis}$ -Separation axioms with its applications

Gradually this section presents some new weak of  $\widehat{gis}$ -separation axioms with theoretical result.

**Definition 4.1** Let  $(X, \tau_o)$  topology space, then  $(X, \tau_o)$  is defined to be:

(i)  $\widehat{gis}$ - $T_0$ , if  $\forall n \neq m \in X, \exists B \subseteq \tau_{\widehat{gis}},$  s.t  $n \in B \wedge m \notin B.$

(ii)  $\widehat{gis}$ - $T_1$ , if  $\forall n \neq m \in X, \exists B \wedge C \subseteq \tau_{\widehat{gis}},$  s.t  $n \in B \wedge m \notin B, m \in C \wedge n \notin C.$

(iii)  $\widehat{gis}$ - $T_2$ , if  $\forall n \neq m \in X, \exists B \neq C \subseteq \tau_{\widehat{gis}},$  s.t  $n \in B \wedge m \in C.$

(iv)  $\widehat{gis}$ -regular, if  $\forall n \notin \lambda \subseteq \bar{\tau}_o, \exists B \neq C \subseteq \tau_{\widehat{gis}},$  s.t  $n \in B \wedge \lambda \subseteq C.$

(v)  $\widehat{gis}$ -normal, if  $\forall v \subseteq \bar{\tau}_o \neq \lambda \subseteq \bar{\tau}_o, \exists B \neq C \subseteq \tau_{\widehat{gis}},$  s.t  $v \subseteq B \wedge \lambda \subseteq C.$

(vi)  $\bar{is}$ - $T_{1/2}$ , if  $\bar{\tau}_{\bar{is}} = \bar{\tau}_i.$

**Example 4.2**  $X = \{\alpha, \beta, \gamma\}, \tau = \{\emptyset, \alpha, X\},$   
 $SO(X) = \{\emptyset, \{\alpha\}, \{\beta, \alpha\}, \{\alpha, \gamma\}, X\} \subset \bar{is} =$   
 $\widehat{gis} = \{\emptyset,$   
 $\{\alpha\}, \{\beta\}, \{\gamma\}, \{\beta, \alpha\}, \{\alpha, \gamma\}, \{\beta, \gamma\}, X\}.$

Clearly,  $\tau$  is  $\widehat{gis}$ - $T_0$ ,  $\widehat{gis}$ - $T_1$ ,  $\widehat{gis}$ - $T_2$ ,  $\widehat{gis}$ -regular,  $\widehat{gis}$ -normal, and  $\widehat{gis}$ - $T_{1/2}$ .

**Theorem 4.3** Every  $\overline{is}$ - $T_0$  (resp.  $\overline{is}$ - $T_1$ ,  $\overline{is}$ - $T_2$ ,  $\overline{is}$ -regular,  $\overline{is}$ -normal,  $\overline{is}$ - $T_{1/2}$ ) are  $\widehat{gis}$ - $T_0$  (resp.  $\widehat{gis}$ - $T_1$ ,  $\widehat{gis}$ - $T_2$ ,  $\widehat{gis}$ -regular,  $\widehat{gis}$ -normal,  $\widehat{gis}$ - $T_{1/2}$ ).

**Proof.** It is evident by using **Lemma 2.4** ■

**Theorem 4.4**  $X$  is a  $\widehat{gis}$ - $T_{1/2}$  iff  $\forall x \in X, \{x\}$  is  $\widehat{gis}$ -open or  $\widehat{gis}$ -closed in  $\widehat{gis}$ - $T_{1/2}$ , i.e.,  $X$  is a  $\widehat{gis}$ - $T_{1/2}$  iff a  $\tau_o$  is a  $\widehat{gis}$ - $T_{1/2}$ .

**Proof.** It obvious from **Definition  $\widehat{gis}$ - $T_{1/2}$**  ■

**Theorem 4.5** if  $\tau \subset \tau_s$ , then  $\tau$  is  $\widehat{gis}$ - $T_{1/2}$ .

**Proof.** Resemble the proof of **Theorem 2.21** ■

**Theorem 4.6** if  $f: \tau_o \rightarrow \sigma_o$  is injection  $\widehat{gis}$ -open mapping, and  $\tau_o$  is  $\widehat{gis}$ - $T_{1/2}$ , then  $\sigma_o$  is  $\widehat{gis}$ - $T_{1/2}$ .

**Theorem 4.7** if  $f: \tau_o \rightarrow \sigma_o$  is injection  $\widehat{gis}$ -irresolute mapping, and  $\sigma_o$   $\widehat{gis}$ - $T_{1/2}$ , then  $\tau_o$  is  $\widehat{gis}$ - $T_{1/2}$ .

**Theorem 4.8** If  $\tau_o = \sigma_o$  are both  $\widehat{gis}$ - $T_{1/2}$ , and  $f$  is injection, then  $f: \tau_o \rightarrow \sigma_o$  is:

(i)  $\widehat{gis}$ -open  $\Rightarrow$  (ii)  $\widehat{gis}$ -continuous  $\Rightarrow$  (ii)  $\widehat{gis}$ -irresolute mappings.

**Proof (i).** Let  $G \neq Q$  are open sets in  $\tau_o$ , since  $f$  is injection and  $\tau_o = \sigma_o$ , then  $f(G) \neq f(Q)$  are open in  $\sigma_o$ . Since  $\sigma_o$  is  $\widehat{gis}$ - $T_{1/2}$ , it implies  $\sigma_o \subset \sigma_{\widehat{gis}}$ , hence  $f(G) \neq f(Q)$  are  $\widehat{gis}$ -open set in  $\sigma_o$ . Therefore,  $f$  is  $\widehat{gis}$ -open mapping ■

**Proof (ii).** Let  $G \neq Q$  are open sets in  $\sigma_o$ , since  $\tau_o$  is  $\widehat{gis}$ - $T_{1/2}$   $f$  is injection  $\widehat{gis}$ -open mapping, then  $f(G)^{-1} \neq f(Q)^{-1}$  are  $\widehat{gis}$ -open sets in  $\tau_o$ . Therefore,  $f$  is  $\widehat{gis}$ -continuous mappings ■

**Proof (iii).** It is obvious by **Theorem 3.15** ■

**Corollary 4.9** If  $\tau_o = \sigma_o$  are both  $\widehat{gis}$ - $T_{1/2}$ , and  $f$  is injection, then  $f: \tau_o \rightarrow \sigma_o$  is  $\widehat{gis}$ -homeomorphism.

**Proof.** It is obvious by **Definition 3.22(i)**

**Corollary 4.10** If  $\tau_o = \sigma_o$  are both  $\widehat{gis}$ - $T_{1/2}$ , and  $f$  is injection, then  $f: \tau_o \rightarrow \sigma_o$ , and  $f^{-1}: \tau_o \rightarrow \sigma_o$  are  $\widehat{gis}$ -irresolute mappings.

**Corollary 4.11** If  $\tau_o = \sigma_o$  are both  $\widehat{gis}$ - $T_{1/2}$ , and  $f$  is injection, then  $f: \tau_o \rightarrow \sigma_o$  is  $\ast\widehat{gis}$ -homeomorphism.

**Proof.** It is obvious by **definition 3.22(ii)**

**Theorem 4.12** If  $f: \tau_o \rightarrow \sigma_o$  is injection  $\widehat{gis}$ -irresolute, and  $\sigma_o$  is  $\widehat{gis}$ - $T_0$ , then  $\tau_o$   $\widehat{gis}$ - $T_2$ .

**Proof.** Suppose  $g \neq q \in \tau_o$  and  $f$  be an injective, then  $f(g) \neq f(q)$  in  $\sigma_o$ . Since  $\sigma_o$  is an  $\widehat{gis}$ - $T_0$ ,  $\exists N \subseteq \tau_{\widehat{gis}}$ , s.t  $f(g) \in N$ ,  $\wedge f(q) \notin N$ ,  $\Rightarrow g \in f^{-1}(N) \wedge q \notin f^{-1}(N)$ . Since,  $f$  is  $\widehat{gis}$ -irresolute, then  $f^{-1}(M) \subset \tau_{\widehat{gis}}$ , then  $g \in f^{-1}(N) \neq q \in f^{-1}(M)$ . Therefore,  $\tau_o$  is  $\widehat{gis}$ - $T_2$  ■

**Theorem 4.13** If  $f: \tau_o \rightarrow \sigma_o$  be a  $\widehat{gis}$ -continuous closed injection. If  $\sigma_o$  is  $\widehat{gis}$ -normal, then  $\tau_o$  is  $\widehat{gis}$ -normal.

**Proof.** Let  $L_1 \subseteq \tau_o \neq L_2 \subseteq \tau_o$ . Since  $f$  is injective and closed,  $f(L_1) \subseteq \overline{\sigma_o} \neq f(L_2) \subseteq \overline{\sigma_o}$ . Since  $\sigma_o$  is  $\widehat{gis}$ -normal, then  $f(L_1) \neq f(L_2)$ ,  $\exists O_1 \subseteq \sigma_{\widehat{gis}} \neq O_2 \subseteq \sigma_{\widehat{gis}}$ , s.t  $f(L_1) \subset O_1 \neq f(L_2) \subset O_2$ , we obtain  $L_1 \subset f^{-1}(O_1) \wedge L_2 \subset f^{-1}(O_2)$ . Since,  $f$  is an  $\widehat{gis}$ -continuous, then  $f^{-1}(V_1) \wedge f^{-1}(V_2) \subseteq \tau_{\widehat{gis}}$ . Also,  $f^{-1}(L_1) \cap f^{-1}(L_2) = f^{-1}(L_1 \cap L_2) = \emptyset$ . Therefore,  $X$  is an  $\widehat{gis}$ -normal ■

**Corollary 4.14** if  $f: \tau_o \rightarrow \sigma_o$  be a  $\widetilde{g}is$ -irresolute closed, and injection. If  $\sigma_o$  is  $\widetilde{g}is$ -normal, then  $\tau_o$  is  $\widetilde{g}is$ -normal.

**Proof.** Since every  $\widetilde{g}is$ -continuous is  $\widetilde{g}is$ -irresolute mapping by **Theorem 3.11** ■

**Corollary 4.15** If  $f: \tau_o \rightarrow \sigma_o$  be a  $\widetilde{g}is$ -irresolute closed injection, and  $\sigma_o$  is  $\widetilde{g}is$ -regular, then  $\tau_o$  is  $\widetilde{g}is$ -regular.

**Proof.** It is obvious from definition of  $\widetilde{g}is$ -regular ■

## CONCLUSIONS AND SUGGESTIONS

The new  $\widetilde{g}is$ -closed and open set that mention in this paper investigated many properties for about the same type and the  $\widetilde{g}is$ -mappings. We can expand about this new  $\widetilde{g}is$ -set by related with other open-closed-generalized closed sets. We also present  $\widetilde{g}is$ - lower separation axioms. In addition, we related this  $\widetilde{g}is$ -separation with advanced  $\widetilde{g}is$ -mappings to reach high-expended theorems. Finally, we do not forget the ability to create other type of generation closed and open sets by using other kinds of open and closed accompanied its applications.
